SUEZ RENEWS CONTRACT FOR 10-YEAR OPERATIONAL PERIOD WITH SHATIN TRANSFER STATION IN HONG KONG

SUEZ has been renewed the contract to design, modify and operate the Shatin Transfer Station. The new contract covers an operational period of 10 years with a contract value of about €54 million.

The Shatin Transfer Station currently has a design throughput of 1,200 tonnes per day municipal solid waste and processes waste collected in urban population centres for onward transportation to North East New Territories Landfill.

Under the new contract, SUEZ is responsible for the design, modifications and operation of the Station. This includes construction and design to modify existing facilities, maintenance work, and replacement of machinery as needed to meet the expanded maximum throughput of 50,000 tonnes per month. SUEZ is also responsible for operating the Station to very high environmental standards – ensuring disposal of permitted waste at designated or alternative landfills. Throughout construction works and operations, SUEZ will perform environmental monitoring and take measures to mitigate the environmental impact of facilities.

Marie-Ange Debon, Senior Executive Vice-President in charge of the International Division of SUEZ, said: *“SUEZ is committed to supporting the Hong Kong government’s Municipal Solid Waste Management Strategy to address the increasing amount of waste in Hong Kong. Our expertise in each stage of the waste cycle, from waste collection and sorting to treatment and recycling, is helping to prevent the build-up of waste in city centres and preserve the environment. The Shatin Transfer Station contract puts into place another 10 years of opportunities for SUEZ to demonstrate our capabilities in innovative resource management.”*

For more than 28 years, SUEZ has provided innovative and tangible waste management solutions in Hong Kong. It currently operates six out of seven transfer stations contracts and two of the biggest and most modern landfills in the world that treat almost 3.8 million tonnes of waste per year. It also manages the restoration, aftercare and after-use of seven closed landfill sites in Hong Kong. It is currently responsible for treating 70% of the waste of the city’s 7.3 million residents.

The Group’s major waste management services in Asia include cleaning and waste collection, operation of refuse transfer stations, waste-to-energy through landfilling and incineration of non-hazardous or hazardous waste, landfill restoration and aftercare, composting, and soil remediation.

About SUEZ

We are at the dawn of the resource revolution. In a world facing rapid demographic growth, urbanisation and a shortage of natural resources, securing, optimising and renewing resources is essential to our future. SUEZ (Paris: SEV, Brussels: SEVB) supplies drinking water to 92 million people; delivers wastewater treatment services to 65 million; collects waste produced by almost 50 million; recovers 14 million tons of waste each year and produces 5,138 GWh of sustainable energy. With 80,990 employees and a presence on all five continents, SUEZ is a key player in the circular economy and the sustainable management of resources. SUEZ generated total revenues of €14.3 billion in 2014.
