treated effluent
Ultrafor™ technology . . .

Ultrafor™ combines both a biological treatment using activated sludge and a clarification by immersion of ultrafiltration membranes. Water to be purified enters into a reactor where it is put in contact with a purifying bacterial mass before passing through the membranes.

**An almost total elimination of SS**: Ultrafor™ functions according to the out / in principle of immersion filtration, in other words a filtration flow from exterior to interior.

Membranes are bundled in modules set within racks, which are placed one next to the other in an immersion tank.

These hollow fiber membranes have of 0.035 µm nominal pore size, which creates a true physical barrier for the elimination of bacteria, and helminth eggs, and a reduction in fecal coliforms.

. . . what it can do for you

- **performance**
  - production of a quality effluent

- **sustainable development**
  - protects nature and its biodiversity with an effluent quality that allows discharge in protected zones
  - population protection with a guarantee of sanitation safety
  - protection of resources thanks to the option of reusing effluent for specific needs (irrigation, watering city parks and gardens, etc.)
  - compact size reduces the environmental footprint

- **safety**
  - a totally automated operation assures the safety of operating partners
